

## Procédurier pour rendre accessible le portfolio *Le Perle* dans votre portail ÉDU-GROUPE

Voici le contenu du fichier portal\_config.php

Modifiez le texte surligné en jaune.

```
<?

// This file is used for configuring how the portal connects to
// epearl. There are a bunch of options.

// ---

$use_host_checking = false;
$allowed_hosts = array(
    "portail.cscs.qc.ca"
);
// EXAMPLE:
//
//     $allowed_hosts = array(
//         "one.server.com",
//         "two.server.com"
//     );
//
// This is a list of hosts (domain names) that can login using login_portal.php.
// You should add your portal's domain here. If you don't want hosts to be checked,
// set $use_host_checking to false;

// ---

$display_splash_screen = true;
// Setting this to true will display a page with the epearl logo on it
// that contains a link that completes login. On some servers, with some
// portals, for users of some browsers - login will not complete properly
// if this is not set to true. Feel free to try it though.
// DETAILS: if epearl is loaded in an iframe, safari, and sometimes IE
// will not log in properly.

// ---

$reject_admin_user = true;
// Setting this to true will prevent the admin user for logging in through login_portal.php.
// It's probably safest to leave it as true.

// ---

$require_portalpass = false;
$portal_login_password = "my_portal_password";
// USE: http://epearl.mydomain.com/login\_portal.php?username=student1&portalpass=abc123
// This is a password that must be passed to login_portal.php in order
// for login to succeed. If you don't want to use a portal login password
```

```

// set $require_portalpass to false;

// ---

// The following are different ways the user can log in from the portal.
// You can control which information you can pass to login_portal.php
// that will trigger a valid login.

$require_username = true; // * recommended
// USE: http://epearl.mydomain.com/login\_portal.php?username=student1&...
// This is the simplest way to log in - we recommend just using this one.

$require_userpass = false;
// USE: http://epearl.mydomain.com/login\_portal.php?...&userpass=123
// The passwords in your portal database are *not* the same as the passwords in
// the epearl database. So, unless you want to enter every student's password into
// the portal one at a time, don't use this.
// But why not just use username :)

$require_useremail = false;
// USE: http://epearl.mydomain.com/login\_portal.php?useremail=student1@mydomain.com
// This is just as good as logging with the username - *but* only if every user
// has an email address, and that email address is the same in the portal database
// and the epearl database.
// But why not just use username :)

$require_usercode = false;
// USE: http://epearl.mydomain.com/login\_portal.php?usercode=stu123456
// This is also just as good as logging in with the username - in fact, the
// username usually is a copy of the student / teacher code. If you have this
// information in the portal database feel free to use it...
// But why not just use username :)

?>

```

À partir de votre portail ÉDU-GROUPE, créez un module nommé « Portfolio *Le Perle* ». Ajoutez une fenêtre indépendante. À l'aide de l'image ci-dessous, complétez le champ texte URL.

Dans votre base de données *Le Perle*, dans la table *users*, le numéro ID de la colonne *username* (en rouge) doit être le même que celui de votre ÉDU\_GROUPE.

	uid	lang	level	user code	user code is custom	pay code	interv code	ocin code	school code	cycle	gender	birthday	user type	username	username is custom	passwd	passwd is custom
